Abstract of the Talk	Cloud computing is an application-based software infrastructure that stores data on remote serves, which can be accessed through the internet. The front end enables a user to seamlessly access data stored in the cloud using an internet browser or a cloud computing software. It enables the users on-demand availability of computer system resources, especially data storage (cloud storage) and computing power, without direct active management by the user. There are three main service models of cloud computing – Infrastructure as a Service (IaaS), Platform as a Service (PaaS) and Software as a Service (SaaS). In the backdrop of Industrial Revolution 4.0 having a high degree of virtualization, significance of cloud computing is increasing every coming day. This webinar aims to explore the all round impact of the Cloud Computing and related issues specially pertaining to safe computing.

All are welcome:
