**Abstract of the Talk**  
Generative AI refers to machine learning models that create new data like input data. This is a key feature as it can produce entirely new data. Generative AI techniques include neural networks, variational autoencoders, generative adversarial networks, and recurrent neural networks. They can generate text, images, music, and video. Applications of generative AI include creating synthetic data for training other machine learning models and generating new content for creative industries. The webinar aims to discuss all these aspects and applications of Generative AI.

**All are welcome:**  
Please circulate this to all your interested colleagues, associates and friends. Please register in large numbers and derive maximum benefit. **Advance registration is mandatory for participation. Participants will also get Participation Certificate.**
